## HASH TABLE

In case of the Hash Table the element is stored in slot $h(k)$; that is, we use a hash function $h$ to compute the slot from the key $k$.
Hash function $h$ maps the universe $U$ of keys into the slots of a hash table $T[0 . . m-1], h: U \rightarrow\{0,1, \ldots, m-1\}$, where the size $m$ of the hash table is typically much less than $|\mathrm{U}|$.
There is one hitch: two keys may hash to the same slot. We call this situation a collision.

## Define the Hash function with the division method

- In the division method for creating hash functions, we map a key $k$ into one of $m$ slots by taking the remainder of $k$ divided by $m$.
- The hash function is $\boldsymbol{h}(\boldsymbol{k})=\boldsymbol{k} \boldsymbol{m o d} \boldsymbol{m}$.
- For example, if the hash table has size $m=12$, then the possible hash values are between 0 and 11. If the hash table has size $m=12$ and the key is $k=100$, then $h(k)=4$.

## Methods for collision problems:

- Open addressing
- Open addressing with chaining
- Separate chaining with Linked List

## Open addressing

- If we have collisions (Linear Probing):
- the alternative slot for a value after a collision is calculated by adding 1 to the current computed slot and taking modulus based on the table size: alternative slot $=(1+$ current slot) mod (table size)
- So we move towards the end of the table and find the first empty slot, and we place the element into the table. If we reach the end of the table, we start it from the beginning.

## Open addressing with chaining

- In case of the open addressing method we know nothing about the places of the overflow element. So we use another column, whose name will be the Pointer.
- In this pointer column we write the address (index) of the overflow value. If there is no overflow, we place the NIL pointer.

## Separate chaining with Linked List

- In chaining, we place all the elements that hash to the same slot into the same linked list.

1. Exercise: There is a hash table which is capable of storing 9 elements.

Define the hash function with the division method.
The following key-value pairs are given:
19 blue
27 red
51 green
13 blue
37 brown
31 pink
25 orange
Place the elements in the table using the following methods:

- Open addressing
- Open addressing with chaining
- Separate chaining with Linked List

## Solution

$$
\begin{aligned}
& \mathrm{m}=9(\text { size of the table }) \\
& \mathrm{h}(\mathrm{k})=\mathrm{k} \bmod 9
\end{aligned}
$$

## Open addressing method

- in case of collision, insert the key-value pair at next free slot

| Key |  | Value |
| :--- | :--- | :--- |
|  | 27 | red |
| 1 | 19 | blue |
| 2 | 37 | brown |
| 3 |  |  |
| 4 | 13 | blue |
| 5 | 31 | pink |
| 6 | 51 | green |
| 7 | 25 | orange |
| 8 |  |  |
|  |  |  |

## Open addressing with chaining method

- in case of collision, save the index of the overflow value

| Key |  | Value | Pointer |
| :---: | :--- | :--- | :--- |
|  | 27 | red | NIL |
| 1 | 19 | blue | 2 |
| 2 | 37 | brown | NIL |
| 3 |  |  |  |
| 4 | 13 | blue | 5 |
| 5 | 31 | pink | NIL |
| 6 | 51 | green | NIL |
| 7 | 25 | orange | NIL |
| 8 |  |  |  |
|  |  |  |  |

## Separate chaining with Linked List

- place all the elements that hash to the same slot into the same linked list

|  | Key | Value | Pointer | $\rightarrow$ | 37 | brown | NIL |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 27 | red | NIL |  |  |  |  |
| 1 | 19 | blue |  |  |  |  |  |
| 2 |  |  |  | $\rightarrow$ |  |  |  |
| 3 |  |  |  |  |  |  |  |
| 4 | 13 | blue |  |  | 31 | pink | NIL |
| 5 |  |  |  |  | 31 |  |  |
| 6 | 51 | green | NIL |  |  |  |  |
| 7 | 25 | orange | NIL |  |  |  |  |
| 8 |  |  |  |  |  |  |  |

2. Exercise: There is a hash table which is capable of storing 9 elements. Define the hash function with the division method. The following key-value pairs are given:

2 Honda
7 Suzuki
9 Mercedes
15 Opel
18 Ford
14 BMW
11 Toyota
21 Tesla
Place the elements in the table using the following methods:

- Open addressing
- Open addressing with chaining
- Separate chaining with Linked List

## Solution

$$
\begin{aligned}
& \mathrm{m}=9(\text { size of the table }) \\
& \mathrm{h}(\mathrm{k})=\mathrm{k} \bmod 9
\end{aligned}
$$

## Open addressing method

| Key |  | Value |
| :--- | :--- | :--- |
| 0 | 9 | Mercedes |
|  | 18 | Ford |
| 2 | 2 | Honda |
| 3 | 11 | Toyota |
| 4 | 21 | Tesla |
| 5 | 14 | BMW |
| 6 | 15 | Opel |
| 7 | 7 | Suzuki |
| 8 |  |  |
|  |  |  |

## Open addressing with chaining method

| Key |  | Value | Pointer |
| :--- | :--- | :--- | :--- |
|  | 9 | Mercedes | 1 |
| 1 | 18 | Ford | NIL |
| 2 | 2 | Honda | 3 |
| 3 | 11 | Toyota | 4 |
|  | 21 | Tesla | NIL |
| 5 | 14 | BMW | NIL |
| 6 | 15 | Opel | NIL |
| 7 | 7 | Suzuki | NIL |
| 8 |  |  |  |
|  |  |  |  |

Separate chaining with Linked List

3. Exercise: There is a hash table which is capable of storing 14 elements. Define the hash function with the division method. The following key-value pairs are given:
19 Blue

27 Red
51 Green
12 Blue
37 Brown
31 Pink
17 Orange
32 White
16 Black
34 Yellow
22 Purple
30 Gold

Place the elements in the table using the following methods:

- Open addressing
- Open addressing with chaining
- Separate chaining with Linked List

## Solution

$$
\begin{aligned}
& \mathrm{m}=14 \text { (size of the table) } \\
& \mathrm{h}(\mathrm{k})=\mathrm{k} \bmod 14
\end{aligned}
$$

## Open addressing method

| Key |  | Value |
| :--- | :--- | :--- |
| 0 |  |  |
| 1 |  |  |
| 2 | 16 | Black |
| 3 | 31 | Pink |
| 4 | 17 | Orange |
| 5 | 19 | Blue |
|  | 32 | White |
| 7 | 34 | Yellow |
| 8 | 22 | Purple |
| 9 | 51 | Green |
| 10 | 37 | Brown |
| 11 | 30 | Gold |
| 12 | 12 | Blue |
| 13 | 27 | Red |
|  |  |  |

## Open addressing with chaining method

|  | Key | Value | Pointer |
| :--- | :--- | :--- | :--- |
| 0 |  |  |  |
| 1 |  |  |  |
| 2 | 16 | Black | 11 |
| 3 | 31 | Pink | 4 |
| 4 | 17 | Orange | 6 |
| 5 | 19 | Blue | NIL |
| 6 | 32 | White | 7 |
| 7 | 34 | Yellow | NIL |
| 8 | 22 | Purple | NIL |
| 9 | 51 | Green | 10 |
| 10 | 37 | Brown | NIL |
| 11 | 30 | Gold | NIL |
| 12 | 12 | Blue | NIL |
| 13 | 27 | Red | NIL |
|  |  |  |  |

Separate chaining with Linked List

## PRACTICE AT HOME

4. Exercise: There is a hash table which is capable of storing 16 elements. Define the hash function with the division method. The following key-value pairs are given:

2 Canada
7 USA
19 Germany
15 France
26 Hungary
34 Romania
21 Spain
28 Portugal
20 Brasilia
55 China
37 Turkey
48 Argentina
74 Denmark

Place the elements in the table using the following methods:

- Open addressing
- Open addressing with chaining
- Separate chaining with Linked List
